 Pred. No. 1s the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score

                                   New isolated human genes
Claim 5; Page 174-176; 184pp; English.
This sequence is encoded by a human gene of the invention, repressed in the presence of tem infection, designated HCMV-repressible genes (crg o crgs). The invention also relates to genes that are induced to express b both HCMV and interferon (IFN), designated HCMV-inducible genes (cig or cigs). The products can be used to obtain agents which can be used for anti-viral therapy, particularly anti-HCMV therapy. They can also be used for the development of drugs that would allow for higher dosage IFN treatments without the concomitant toxicity normally associated with administering high levels of IFN. The products can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a novel ceramide glucosyltransferase (GlCT-1), which has catalytic activity for glucose transfer from UDP-glucose to ceramide. Ceramide glucosyltransferase catalyses the first glycosylation step of glycosylingoceramide to produce glucosylceramide, a precursor to more than 300 glycosphingolipid biotechnology areas as laboratory agents, and also as preparatory gagents, for the manufacture of pharmacological active substances. It is expected to have use in therapeutic and preventive treatment of diseases based on reduced expression of ceramide
                                                                                                                                                                                                                                                                                                                                                                                                                                          Human HCMV repressible gene protein, SEQ ID NO 35.

                                                                                                                                                                                                                                                                                                                                                                                                     DNA derived from colonic epithelium encoding IgG-Fc binding protein used in the mapping and analysis of IgG-Fc binding protein mRNA Claim 1; Page 71-84; 132p; Japanese.

This sequence is encoded by fragment 13 which is a NotI/KpnI fragment from pNVII-5T. This sequence represents a portion of the IgG-Fc binding protein of human colonic epithelium. This sequence was used in the isolation of the full length sequence given in W14749. mRNA isolated from human colonic epithelial tissue was used to prepare a cDNA library. This was screened using monoclonal antibodies K9 and K17 which bind to the large and small components of the binding protein. Pactive clones, see also TG3077-81, were used to derive probes for screpning a second DNA library from human colonic epithelial tissue.

PT New modified butyrophilin - not cross-reactive with myelin proligo-dendrocyte glycoprotein useful in dairy products, vaccines, products assays for susceptibility to multiple sclerosis

PS Disclosure; Page 46-47; 53pp; English.

CC. This polypeptide comprises the rat myelin oligodendrocyte production (MGG). The invention relates to butyrophilin (BTN, CC. See W97812-16), a major component of the milk fat globule membrane component of BTN has a high degree of identity with the Igv component of the immunoglobulin (Ig) superfamily. The intermediate membrane component of BTN has a high degree of identity with the Igv component of antibodies which cross-react with endogenous MGG, and component of antibodies which cross-react with endogenous MGG, and component of antibodies which cross-react with endogenous MGG, and component to MGG, e.g. by removing or modifying the IgI domain of a component of the endogenous BTN (nham) in a diary product, or by producing a numanised chimeric BTN. The invention includes genetic manipulation cof the endogenous BTN gene of an animal such that the human IgI component of the endogenous BTN gene of an animal such that the human patient from the component of the subman patient from the component of the component of the component of the milk. Methods are component of the component of the subman patient from the component of the subman patient from the component of the component of the subman patient from the component of the component
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT

This sequence represents the IgG-Fc binding protein of human colonic epithelium. This sequence was isolated using the sequence given in w14748. mRNA isolated from human colonic epithelial tissue was used to prepare a cDNA library. This was screened using monoclonal antibodies K9 and K17 which bind to the large and small components of the binding protein. Active clones, see also T63077-81, were used to derive probes for screening a second DNA library from human colonic epithelial tissue. Sequence 5405 AA;

gene with domains which are
Hydra head activator binding protein - useful in screening assay for agonists or antagonists. Claim 3; Page 6-11; 21pp; German.
This sequence represents a head activator binding protein isolated from Chlorchydra viridissima by chromatographic methods. The protein is used in a screening assay for agonists or antagonists comprising determining the binding properties of candidate substances with the protein. The assay can be used to screen for substances useful for treating neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hydra head activator binding protein. Synthetic specific binding agent and reshaped human antibody specific for human polymorphic epithelial mucin for treatment and in-wivo diagnosis of pen-producing cancers

Claim 11; Fig 12; 62pp; English.

The reshaped antibody sequence was deduced from the sequence of a reshaped human variable heavy chain gene which had a human class I framework but contained mouse CDRs. To reshape a human heavy chain framework but contained mouse CDRs. To reshape a human heavy chain

Expression of the chimaeric gene inhibits infection of plants (p: sorghum, sugarcane, esp. maize) by MDMV. The transgenic plants display an inheritable resistance trait.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         viral protein
Claim 20; Page 31-44; 64pp; English.
The sequence of the polyprotein encoded by the polycistronic mRNA
(T47073) of maize dwarf mosaic virus strain B (MDMV-B) is given in
W10344. New chimaeric genes comprise a monocotyledonous plant
promoter linked to a modified nucleic acid sequence derived from
the MDMV-B genome. The modification is such that mRNA is translated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       wPI; 97-108965/10.

R54758 showes an humanised HMFGI heavy chain variable region. The
mouse HMFGI is changed at specific residues within the framework region.
It is used to generate an SCFV with the humanised HMFGI light chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              region

The proteins given represent the signal peptide and an CC N-terminal fragment of a secreted protein. The nucleic acid sequences CC can be used for producing secreted human gene products. They can also CC be used to develop products for diagnosis and therapy. The proteins CC obtained may have cytokine activity, cell proliferation/differentiation CC activity, hemmatopoiesis regulating activity, tissue growth regulating CC chemokinetic activity haemostatic and thrombolytic activity, receptor/CC ligand activity, anti-inflammatory activity, tumour inhibition activity cor other activities. The products can be used in forensic, gene therapy CC and chromosome mapping procedures. The sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptide can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a membrane, or Sequence 133 AA;

Nucleic acids encoding human serum protease protein(s) - used diagnosing pre-disposition to Alzheimer's disease, etc. Example 2; Page 18-19; 65pp; English.

The sequence is that of at least a fragment of the serine protease PSP1. This can be used to identify modulators of serine protease activity and also to diagnose a condition associated with lack of one of the serine proteases or a genetic predisposition to neurodegeneration in a patient, preferably predisposition to Alzheimer's disease.

                                 New polypeptide(s) involved in cobalamin and cobamide biosynthesis - and DNA encoding them, for amplification of cobalamin, esp. coenzyme B12 prodn, Claim 17; Fig 16; 299pp; French.

This sequence corresponds to one of 24 polypeptides obtained from p. dentrificans and implicated in the biosynthesis of cobalamines and/or cobamides, specifically in catalysing the transfer of a methyl group to positions C1, C5, C11, C15 or C17 in the conversion of precorrin-3 to cobyrinic acid a, c-diamide. It is encoded by part is the 8.7kb EcoRI-EcoRI fragment of plasmid pXL367. The plasmid was insolated from a P.denitrificans genomic DNA bank constructed in

Nucleic acids enoding human serum protease protein(s) - us diagnosing pre-disposition to Alzheimer's disease, etc. Claim 7; Page 41-42; 65pp; English.

The sequence is that of the consensus sequence of PSP1-3 serine protease which can be used to identify modulators of serine protease activity and also to diagnose a condition associated with lack of one of the serine proteases or a genetic predisposition to neurodegeneration in a patient, preferably predisposition to Alzheimer's disease.

No. is the number of results predicted by chance to have
score greater than or equal to the score of the result being pr
and is derived by analysis of the total score distribution.

14.5dpc embryos [total RNA provided by Minoru Ko, Wayne State Univ. from 2]; double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT/T3 vector. Library went through one round of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo. "

(CACTGTGTG); Site_2: DraIII (CACCATGTG); 1st strand cDNA
was primed with an oligo(dT) primer
[ATGTGGCCTTTTTTTTTTTTTTTTT]; double-stranded cDNA was
ligated to a DraIII adaptor [TGTTGGCCTACTGG] digested
and cloned into distinct DraIII sites of the pME18S-FL3
vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should
be used to isolate the cDNA insert. Size selection was
performed to exclude fragments <1.5kb. Library
constructed by Dr. Sumio Sugano (University of Tokyo
Institute of Medical Science). Custom primers for
sequencing: 5' end primer CTTCTGCTCTAAAAGCTGCG and 3' end
primer CGACCTGCAGCTCGAGCACA."

     [ATGTGGCCTTTTTTTTTTTTTT]; double-stranded cDNA was ligated to a DraIII adaptor [TGTTGGCCTACTGG], digested and cloned into distinct DraIII sites of the pME18S-FL3 vector (5' site CACTGTGTG, 3' site CACCATGTG). XhoI should be used to isolate the cDNA insert. Size selection was performed to exclude fragments <1.5kb. Library constructed by Dr. Sumio Sugano (University of Tokyo Institute of Medical Science). Custom primers for sequencing: 5' end primer CTTTTGCTTCTAAAAGCTTGCG and 3' end primer CGACCTGCAGCTCGAGCACA."

cc method of the invention. The plasmid contains an adenovirus type 5 ct 4 regulatory gene and a hygromycin resistant gene. The invention cc provides adenoviral vectors having deletions of all or part of correct or various gene sequences encoding adenoviral structural proteins. Cc Deletions in the structural proteins would allow a reduced risk of cwild-type virus contamination and would also allow packaging of foreign cc DNA in such vectors for a variety of diagnostic and therapeutic camplications. The adenoviral vectors having deletions in the structural gene regions are produced by cellular complementation of these complementation plasmid which was introduced into a sa complementation plasmid which was introduced into a host cell line where parts of the E4 gene region would be stably inserted into the cc where parts of the E4 gene region would be stably inserted into the cc where parts of the E4 gene region would be stably inserted into the cc as a gene delivery vector. The vectors can be used for diagnosis or gene therapy, e.g. for treating conditions characterised by the crown of the call (e.g. tumours), genetic diseases (e.g. through the conditions characterised by cromitations (e.g. HIV infection). They can also be used for in vitro cc production of biologically active proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş

PI Memerow GR, Von Seggern DJ;

PT or fibre protein used particularly for gene therapy

PS Example 1; Pages 131-145; 170pp; English.

CC The present sequence is that of a pE4/Fiber plasmid used in the

CC method of the invention. The plasmid contains an adenovirus type 5 (AD5)

CC fiber gene controlled by a CMV promter, an AD5 E4 gene and an adenovirus

CC type 2 (AD2) tripartite leader sequence upstream of the fiber gene. The

CC various gene sequences encoding adenoviral structural proteins and/or

CC various gene sequences encoding adenoviral structural proteins and/or

CC early region proteins. Deletions in these proteins would allow a

CC reduced risk of wild-type virus contamination and would also allow

CC packaging of foreign DNA in such vectors having deletions in
